

4.5M Medians and Outer Separations

4.5.4M Outer Separations and Frontage Road Separations: Application Heuristics

The TAC Subsection **4.5.4** is applicable to the Department's highways with the following substitution:

The bullet point that reads:

- On rural freeways, the width of an outer separation may be influenced by side slope geometrics and longitudinal ditch drainage gradients, and is typically 20 m to 35 m.

Is to be replaced with:

- Where service roads are present, the minimum separation between the outside edge of the through lanes on the main lanes and the closest edge of lane of the service road should be 22 m, with a desired separation of 30 m. See Figure 4.5.3M below.

Figure 4.5.3M Service Road Separation
