FOREWORD

The Manitoba Highway Traffic Information System (MHTIS) is a partnership between Manitoba Infrastructure and Transportation (MIT) and the University of Manitoba Transport Information Group (UMTIG).

The Manitoba Highway Traffic Information System is planned, designed, implemented, and operated by graduate students who are EITs or are registered as professional engineers, working under the direction of professional engineers with expertise in traffic measurement and estimation. The MHTIS director is Dr. Jeannette Montufar, P. Eng.

Raw data concerning traffic on Manitoba highways is provided by Manitoba Infrastructure and Transportation. The data is processed, analyzed, and summarized by the students in accordance with established procedures. The final decision of acceptance or rejection of traffic data rests with the MHTIS Manager.

Manitoba Infrastructure and Transportation provides no warranties as to the validity or accuracy of the information presented herein.

For further information related to this report, please visit the MHTIS website at: www.mhtis.mb.ca or contact MHTIS by email: mhtis_info@umanitoba.ca or by phone: (204) 474-7367.

REPORT CONTENTS

Section I: Introduction

Section I provides background information regarding the traffic counting program in Manitoba.

1. **Traffic Monitoring Program**
 - 1.1 Permanent Traffic Count Stations
 - 1.2 Coverage Traffic Count Stations
 - 1.3 Town Count Stations
 - 1.4 Manual Turning Movement and Classification (Titan) Counts
 - 1.5 Miovision Video Collection Unit Counts
2. **Traffic Information Presented in the Report**
 - 2.1 Terminology
 - 2.2 Permanent Counting Station Graphs
3. **Methodology**
 - 3.1 Coverage Count Station AADT Expansion
 - 3.2 Traffic Pattern Groups
4. **References**
5. **Additional Resources**

Section II: Permanent Traffic Count Stations

Section II provides detailed information about traffic volumes at the permanent traffic count stations operated by Manitoba Infrastructure and Transportation in 2014.

Section III: Traffic Statistics for Provincial Trunk Highways and Provincial Roads

Section III contains traffic statistics (AADT, ASDT%, 30thHour%) for provincial trunk highways and provincial roads in Manitoba.

Section IV: Town Count Stations

Section IV contains average daily traffic estimates for town count stations in Manitoba.

Appendix A: Coverage Count Raw Data

Appendix A contains raw data collected by Manitoba Infrastructure and Transportation at short-term count stations (or coverage count stations) in 2014.

Appendix B: Traffic Information via the Internet

Appendix B describes the traffic information available on the MHTIS website and provides step-by-step instructions for accessing information via the webmap application.

Appendix C: Traffic Counter Location Maps

Appendix C contains maps showing the location of all counter sites (permanent and coverage) in Manitoba.

Appendix D: Intersection Count Locations (Titan and Miovision)

Appendix D lists the locations of all Titan and Miovision counts in Manitoba since 2007.

1. TRAFFIC MONITORING PROGRAM

There are four main sources used in the collection of traffic data by Manitoba Infrastructure and Transportation. They are permanent traffic count stations, coverage count stations, town count stations, and intersection turning and classification counts. This report presents statistics derived from permanent, coverage, and town count station data. Manual turning and classification counts are listed in Appendix D.

1.1 Permanent Traffic Count Stations

Permanent traffic count stations provide continuous traffic information on a year-round basis, except when data collection is interrupted due to equipment failure, construction, road closures, or other issues. Traffic volumes are estimated for all permanent traffic count stations where there is sufficient data. The main criterion for sufficiency is that at least one occurrence of each day-of-the-week (Monday through Sunday) must be present in each month of the year for each station-direction. In the 2014 traffic report, 78 permanent traffic count stations are included, and of these, 63 met the main criterion for sufficiency and were used to estimate traffic on Manitoba highways. Of the remaining 15 stations, 6 stations (47, 63, 65, 74, 79, and 80) had insufficient data to produce an AADT estimate for 2014. Location information and detailed traffic flow statistics for all permanent traffic count stations are presented in Section II: Permanent Traffic Count Stations. Appendix C shows the location of all count stations.

1.1.1 Description of Station Types

Permanent count stations (PCS) or automated traffic recorders (ATR) are designed to count traffic each hour of the day throughout the year. There are 3 types of permanent count stations in operation in Manitoba:

- **Autopoll PCS (also referred to as “PCS” or “Regular PCS”):** These stations only count the total number of vehicles passing. No weight or classification data is collected.
- **AVC:** Automatic Vehicle Classifiers collect speed, count, classification and axle spacing data.
- **WIM:** Weigh-in-Motion devices collect speed, count, classification, axle spacing data and weight.

1.1.2 Permanent Count Stations (PCS)

In 2014, there were 27 PCS stations which used either Autopoll (count) or Trafman equipment (count and classification). During 2014, no stations were upgraded to Automatic Vehicle Classifiers.

1.1.3 Automatic Vehicle Classifiers (AVC) and Weigh-in-Motion (WIM)

Automatic Vehicle Classifiers (AVC) and Weigh-in-Motion (WIM) devices operate year-round and are used to develop traffic volume and classification statistics at the monitoring locations. AVC stations provide speed and axle spacing data; WIM stations provide speed, weight and axle spacing data, which are not included in this report.

In 2014, there were 45 AVC stations, 4 combined WIM/AVC stations, and 2 WIM-only stations being operated in Manitoba (note that Station 64 is a combined WIM/AVC, but only the AVC data is used for the traffic estimates so it is counted in the 45 AVC stations and not in the 4 WIM/AVC stations).

Manitoba operates pavement test sections that are equipped with WIM devices and AVCs in connection with the Long Term Pavement Performance (LTPP) Project and the Canadian Strategic Highway Research Program (C-SHRP). In general, each WIM sensor monitors one lane of traffic at the test location and AVC equipment monitors the remaining lanes.

1.2 Coverage Traffic Count Stations

1.2.1 Description of Station Types

Coverage count stations (CCS) are short-term traffic count stations where sites are often surveyed on a three-year cycle. On the selected cycle year coverage count stations are typically surveyed 2 times a year for 48 hours each time. Two types of CCS are listed in this report:

- **Loop** – Coverage count stations with an induction loop which detects the passage of a vehicle.
- **Tube** – Coverage count stations with a pneumatic road tube-counter which counts vehicle axles.

1.2.2 Coverage Count Stations (CCS)

Traffic volumes are estimated at approximately 1500 locations on provincial highways and provincial roads from coverage counts consisting of short-period samples of traffic conditions. Most sites are now surveyed on a three-year cycle. Coverage count stations are typically surveyed twice for 48 hours each time in the year in which they are counted. Most of the sites are counted with pneumatic tube counters, but induction loops are being installed across the province gradually. In 2014, 1142 coverage count surveys were conducted and accepted at 559 separate locations.

Detailed statistics for coverage count stations are presented in Section III: Traffic Statistics for Provincial Trunk Highways and Provincial Roads. The estimates presented are based on the application of calculated factors to the survey data. Therefore, some inherent variation is to be expected. Care should be taken in the use of this information. For detailed explanations of the techniques used to calculate all statistics, see Section 3 - Methodology.

1.3 Town Count Stations

In addition to highway counts, town counts are conducted on selected town roads as part of the coverage count program. Town counts are not expanded by traffic pattern groups; rather they are based directly on the coverage count raw data for the station. The estimates shown are the average number of vehicles per day, obtained by dividing the raw counts by the number of days that the count was conducted. Axle correction factors using the most recent estimate of the percent trucks at that location are applied for tube counters. For stations that do not have an estimate of percent trucks, an average value of 9% is used. Data for town count stations can be found in Section IV: Town Count Stations. Users of traffic data should take special care when using data from town counts.

1.4 Intersection Turning Movement and Classification Counts

Manual turning movement and vehicle classification counts are conducted using electronic “Titan” counting boards and are collected on an as-required basis. The standard count period consists of two seven-hour shifts; 07:00-14:00 and 14:00-21:00. There are two types of Titan counts; FHWA counts classify vehicles into the 15 FHWA Scheme F classes and Count-4 (CTP) counts classify cars, small trucks, large trucks, and pedestrians. Count-4 (CTP) counts classify small trucks as FHWA classes 4 through 7 and large trucks as FHWA classes 8 through 15. Refer to Appendix D for the list of all turning movement counts conducted since 2008. Details of pre-2008 turning movement counts are available in previous reports and on the MHTIS webmap at: www.mhtis.mb.ca.

Beginning in 2012, Miovision Video Collection Units have been deployed at intersections where Titan Count-4 counts have been previously deployed. Miovision counts are typically 48 hours in duration and classify vehicles by length into cars, medium trucks, and heavy trucks in addition to pedestrians and cyclists. These counts are processed as Titan counts in this report.

2. TRAFFIC INFORMATION PRESENTED IN THE REPORT

2.1 Terminology

2.1.1 Annual Average Daily Traffic (AADT)

The AADT is defined as the number of vehicles passing a point on an average day of the year. In Section II: Permanent Traffic Count Stations, combined and directional AADT estimates are reported for each station as available. The combined AADT is the sum of the AADTs of the two directions of travel. In Section III: Traffic Statistics for Provincial Trunk Highways and Provincial Roads, the reported combined AADT is based on the sum of the two directions. The AADT is reported by direction of travel at locations where the traffic volume is recorded by direction.

The procedure for estimating AADT at permanent traffic count stations follows the AASHTO formulation outlined in the *Traffic Monitoring Guide*, Section 3 (2001). The procedure follows these steps:

- Calculate the Monthly Average Day-of-Week Traffic (MADWT) for each day-of-the-week (Monday through Sunday), for each month.
- Calculate Annual Average Day-of-Week Traffic (AADWT) for each day-of-week using the sum of each day-of-week's MADWTs divided by the number (12) of MADWTs in that day-of-week.
- The AADT is the sum of the AADWTs divided by the number (7) of AADWTs.

The AADT is calculated using the following equation:

$$AADT = \frac{1}{7} \sum_{i=1}^7 \left[\frac{1}{12} \sum_{j=1}^{12} \left(\frac{1}{n} \sum_{k=1}^n VOL_{ijk} \right) \right]$$

where: VOL = daily traffic for day k , of day-of-the-week i , and month j
 i = day-of-the-week
 j = month
 k = 1 when the day is the first occurrence of that day-of-the-week in a month, 2 when it is the second occurrence of that day-of-the-week in a month, etc.
 n = the number of days of that day-of-the-week during that month (between 1 and 5, depending on the number of days with missing data).

For permanent traffic count stations, AADT estimates are made for each direction and then summed to give a combined AADT. If there is sufficient data for an AADT estimate in one direction but not the other, the combined AADT may be estimated based on twice the existing directional AADT.

Missing data, resulting either from counter failure, maintenance, construction, or other issues, resulted in some stations having their AADT or AADTT calculated based on twice the AADT or AADTT of one flow direction, or not estimated for 2014. These stations are shown in Table 1.

Table 1: Stations without AADT/AADTT Estimates or Requiring an AADT/AADTT Expansion Calculation

AADT Not Estimated	AADTT Not Estimated	AADT Twice One Flow Direction	AADTT Twice One Flow Direction
47	46	15	15
63	49	66	20
65	52		31
74	60		66
79	63		
80	65		
	79		
	80		
	91		

2.1.2 Annual Average Daily Truck Traffic (AADTT)

The AADTT is defined as the number of trucks passing a point on an average day of the year. The combined AADTT is the sum of the AADTTs of the two directions of travel. This report presents AADTT estimates at WIM and AVC stations. The procedure for estimating AADTT is similar to the procedure for estimating AADT which follows the AASHTO formulation outlined in the *Traffic Monitoring Guide*, Section 3 (2001). For more detailed truck traffic estimates on Manitoba highways, see the report *Traffic Data Requirements for the Mechanistic-Empirical Design of New and Rehabilitated Pavement Structures in Manitoba* (Jablonski et al. 2010).

2.1.3 Average Summer Daily Traffic Percentage (ASDT%)

The average summer daily traffic is the number of vehicles passing a point on an average day during the period May 1 through September 30. The ASDT% is expressed as a percentage of the AADT. At coverage count stations, this value is assumed to be the same as the ASDT% at the permanent counter designated as that site's control station.

2.1.4 30th Highest Hour Percentage (30th Hour % or 30HH)

At permanent traffic count stations, the 30th Highest Hour statistic is obtained by ranking all hourly volumes observed in the year and calculating the percentage of the AADT that the 30th highest hourly volume represents. At coverage count stations, the 30th Highest Hour is assumed to be equal to the 30th Highest Hour at the permanent counter designated as that site's control station.

2.2 Permanent Count Station Graphs

The following discussion refers to the charts and graphs shown in Section II of this report. A schematic of the traffic statistic charts are shown in Figure 1.

2.2.1 Annual Average Daily Traffic Chart

This chart shows the historic record of combined AADT at the station (for the last 12 years or as available). For AVCs and WIMs, a historic record of combined AADTT is shown in isolation and as a proportion of AADT.

2.2.2 Vehicle Class Distribution

This chart depicts the vehicle class distribution as a percent of total vehicles passing the station. Manitoba uses the FHWA Scheme F for vehicle classification (see Figure 4 on Page 1-7). Class 5 to 13 vehicles are considered trucks and class 1 to 4 vehicles are considered non-trucks. The insert in this chart depicts the truck class distribution as a percent of total number of trucks passing the station.

2.2.3 Highest 100 Hourly Volumes

This graph is developed by ranking the combined-direction hourly traffic totals for all observed hours in the year, and plotting the 100 highest volume hours as a percent of the AADT. In some cases, the highest hours of the year experience 50 percent or more of an entire average day's traffic in a single hour. The 30th highest hour is provided as a percent of the AADT. Where stations are missing large quantities of data, it is possible that the missing data include some of the high-volume hours.

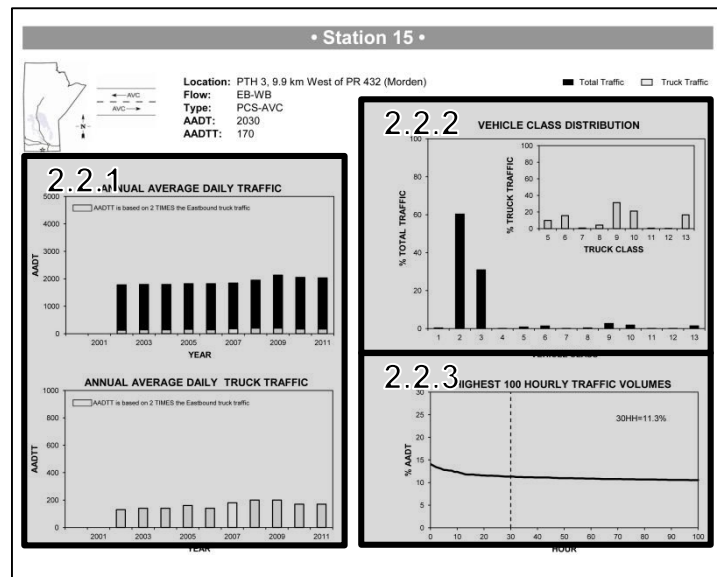

Figure 1: Schematic of Traffic Statistic Charts in Section II

2.2.4 Total Traffic Variation

Total traffic variations are shown by hour of day, day of week, and month. For AVCs and WIMs, truck traffic variation is shown in isolation and as a proportion of total traffic variation. Figure 2 illustrates the total traffic variation charts found in Section II.

Average hourly traffic variation

The hourly variation chart depicts the combined average hourly traffic characteristics as a percent of AADT for all days of the week in the whole year. The graph shows the percent of AADT for each hourly interval. For example, a site showing 8% at 16:00 means that on an average day, 8% of the site's AADT passes during the one-hour period beginning at 16:00.

Day of week traffic variation

The day of week variation chart depicts combined average traffic characteristics as a percent of AADT over the course of a week. For example, a site showing 115 percent on Friday means that the average total traffic on Fridays in the year is 115 percent of the AADT.

Monthly traffic variation

The monthly variation chart depicts combined average daily traffic volumes as a percent of AADT for each month of the year. For example, a site showing 120 percent for June means that on average, the total traffic for one day in June is 120 percent of the site's AADT.

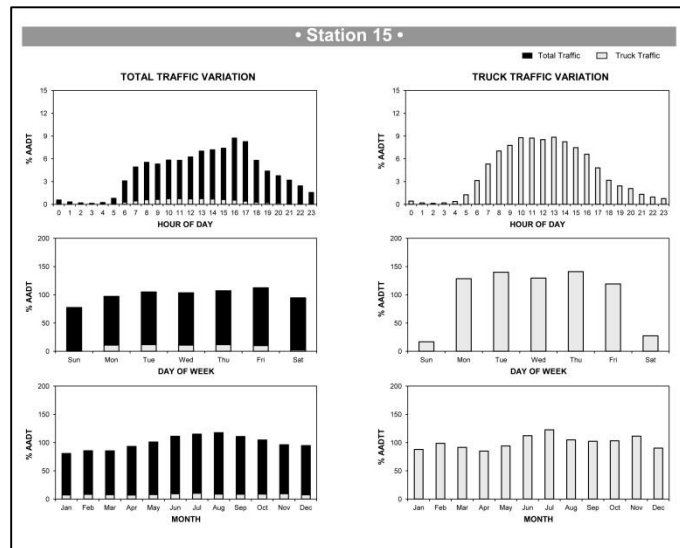

Figure 2: Example of Total Traffic Variation Charts in Section II

2.2.5 Daily Traffic Counts

These graphs show the observed traffic volumes for each day over a period of four years. Note that equipment failures or removals result in missing observations (depicted as gaps in the daily traffic count charts). For AVCs and WIMs, daily truck traffic counts are shown separately and as a proportion of total traffic counts. Figure 3 reveals the daily traffic count graphs from Section II.

Figure 3: Example of Daily Traffic Count Graphs in Section II

	<p>FHWA Class 1 - Motorcycles</p>
	<p>FHWA Class 2 - Passenger Vehicles (With 1- or 2-Axle Trailers)</p>
	<p>FHWA Class 3 - 2-Axles, 4-Tire Single Units, Pickup or Van (With 1- or 2-Axle Trailers)</p>
	<p>FHWA Class 4 - Buses</p>
	<p>FHWA Class 5 - 2D - 2 Axles, 6-Tire Single Units (Includes Handicapped-Equipped Bus and Mini School Bus)</p>
	<p>FHWA Class 6 - 3 Axles, Single Unit</p>
	<p>FHWA Class 7 - 4 or More Axles, Single Unit</p>
	<p>FHWA Class 8 - 3 to 4 Axles, Single Trailer</p>
	<p>FHWA Class 9 - 5 Axles, Single Trailer</p>
	<p>FHWA Class 10 - 6 or More Axles, Single Trailer</p>
	<p>FHWA Class 11 - 5 or Less Axles, Multi-Trailers</p>
	<p>FHWA Class 12 - 6 Axles, Multi-Trailers</p>
	<p>FHWA Class 13 - 7 or 8 Axles, Multi-Trailers</p>
	<p>FHWA Class 14 - 9 or 10 Axles, Multi-Trailers</p>
	<p>FHWA Class 15 - 11 or More Axles, Multi-Trailers</p>

3. METHODOLOGY

3.1 Coverage Count Station AADT Expansion

Coverage counts, or short-term counts, are expanded by directly comparing the short-term observed volume with the hourly data from the station's volume control station or traffic pattern group (TPG). An axle conversion factor is applied in the case of tube counters (see Section 3.1.1 Axle Conversion Factors).

The method used for expanding short-period counts is based on the assumption that when a short sample of traffic is taken at the survey site and at the control site, each sample represents the same proportion of the site's AADT. The short-period count is converted to an AADT estimate by the following equation:

$$\frac{V_{site}}{AADT_{site}} = \frac{V_{ctrl}}{AADT_{ctrl}}$$

where: V_{site} = Volume recorded at the CCS site
 V_{ctrl} = Volume recorded in the same time period at the control station or group
 $AADT_{site}$ = Estimated AADT at the CCS site
 $AADT_{ctrl}$ = Calculated AADT at the control station or group

The $AADT_{ctrl}$ is the calculated AADT for the last reporting period at the control station. The V_{ctrl} is the observed volume at the control station during the same time period as the short-term count was taken. If data are not available for V_{ctrl} , then the ratio $V_{ctrl}/AADT_{ctrl}$ is taken to be the average ratio for that time period for all sites that fall within the appropriate traffic pattern group.

3.1.1 Axle Conversion Factors

Axle conversion factors are calculated based on the most recent available estimate of the percentage of trucks in the traffic stream at the given location, assuming that trucks have an average of five axles. Axle conversion factors are applied to raw coverage count data obtained from tube counters prior to the expansion procedure. MIT tube counters register one impulse for every axle that passes over the tube. The axle conversion factor, then, is given by:

$$(1 - \%T) + (2.5 \times \%T)$$

where: $\%T$ is the most recently available percentage of trucks on the road, or the default value of 10% (expressed as a decimal). The percentage of trucks is the ratio of AADTT to AADT estimated at a given location. These percentages are derived from AVC data, WIM data or manual counts, using the most recent information available.

3.1.2 Control Stations

Control stations are required to expand short-period counts. Control stations are permanent count stations that have traffic flow characteristics similar to those at the short-period survey location. Most coverage count stations have a control station designated for expansion. Where no control station has been identified or there is a problem obtaining data from it, the site's traffic pattern group is used. Control stations were selected by UMTIG personnel through a methodology outlined in Regehr et al., (2006). This methodology assigns the coverage count station to a permanent count station in the same TPG as the coverage count station. The coverage count station is assigned based on consideration of the following:

- Physical proximity to the permanent traffic count station
- Relevant geographic characteristics
- Location on the same highway
- Temporal traffic patterns
- Engineering judgement

3.2 Traffic Pattern Groups

Traffic pattern groups (TPGs) were originally established in 1993 on the basis of seasonal and hourly traffic volume patterns at permanent traffic count stations (Clayton and Lucas 1993). The assignment was based on an algorithm originally developed by Ward (1963) and applied to traffic counter grouping by Sharma and Werner (1981). Yeow (1997) redefined the TPGs by the seasonal and average hourly traffic patterns at permanent traffic count stations, based on the same grouping method as in 1993.

More recently, Regehr et al. (2006) revised Yeow's grouping to include new permanent count stations that were added to the traffic monitoring system since 1996. Seven TPGs resulted from the re-assignment. Details of the method and evaluation are available in the report entitled *Manitoba Highway Traffic Information System: System Maintenance and Upgrade* (Regehr et al. 2006). The following describes the characteristics for each of the seven TPGs.

3.2.1 Traffic Pattern Group 1 (TPG1)

TPG1 sites are located on routes near the major urban centers of Winnipeg and Brandon. They are characterized by:

- High morning and afternoon peaks on weekdays
- Steady weekday traffic with a moderate Friday peak and lower weekend traffic
- Low seasonal variations

3.2.2 Traffic Pattern Group 2 (TPG2)

TPG2 sites are located on routes that are not adjacent to population centers and that serve longer-trip purposes. They are characterized by:

- Steady traffic that increases and decreases throughout the day on weekdays and weekends
- Steady weekday traffic with a moderate Friday peak and lower weekend traffic, similar to TPG1
- Moderate seasonal variations

3.2.3 Traffic Pattern Group 3 (TPG3)

TPG3 sites are similar to TPG2 sites, but are on routes that serve longer-trip purposes leading to recreational destinations. They are characterized by:

- Weekday afternoon peaks that are higher than weekday morning peaks
- Weekday traffic that is lower than weekend traffic with high Friday and Sunday peaks
- A very high summer peak

3.2.4 Traffic Pattern Group 4 (TPG4)

TPG4 sites are located on routes that lie adjacent to rural population centers such as Dauphin, Morden, and Swan River. They are characterized by:

- Weekday afternoon peaks that are higher than weekday morning peaks
- Steady weekday traffic with a moderate Friday peak and lower weekend traffic, similar to TPG1
- Low seasonal variations, similar to TPG1

3.2.5 Traffic Pattern Group 5 (TPG5)

TPG5 sites are located on routes that lie adjacent to population centers and also lead to recreational destinations. They are characterized by:

- Weekday afternoon peaks that are higher than weekday morning peaks (similar to TPG4) and a steady increase in weekend traffic throughout the day
- Steady weekday traffic with moderate Friday and Sunday peaks
- A high summer peak

3.2.6 Traffic Pattern Group 6 (TPG6)

TPG6 sites are located on routes that mainly connect to recreational destinations such as Whiteshell Provincial Park and Riding Mountain National Park. They are characterized by:

- Very high daytime weekend traffic volumes compared to daytime weekday traffic volumes
- Weekday traffic lower than weekend traffic with high Friday and Sunday peaks, similar to TPG3
- A very high summer peak, similar to TPG3

3.2.7 Traffic Pattern Group 7 (TPG7)

TPG7 sites are located on routes that are located in northern Manitoba (Region 5, north of the intersection of PTH 6 and PTH 60). These routes carry some commuter traffic and connect to recreational destinations. TPG7 sites are characterized by:

- Weekday afternoon peaks that are higher than weekday morning peaks, similar to TPG4
- Steady weekday traffic with a moderate Friday peak and lower weekend traffic, similar to TPG1
- High summer peak, similar to TPG5

Baumgartner Thomas, Regehr Jonathan, Montufar Jeannette (2010), "Urban and Regional Transportation Emissions Modelling: Development of Spatial, Temporal, and Vehicle-Specific Factors for Manitoba, Part B Fuel Consumption and Emissions of Turnpike Doubles," for Environment Canada.

Jablonski Ben, Regehr Jonathan, Rempel Garreth, Baumgartner Thomas, Nuñez Aldo, Patmore Keenan, Moshiri Maryam, Hernandez Henry, Montufar Jeannette (2010), "Traffic Data Requirements for Mechanistic-Empirical Design of New and Rehabilitated Pavement Structures in Manitoba," for Manitoba Infrastructure and Transportation.

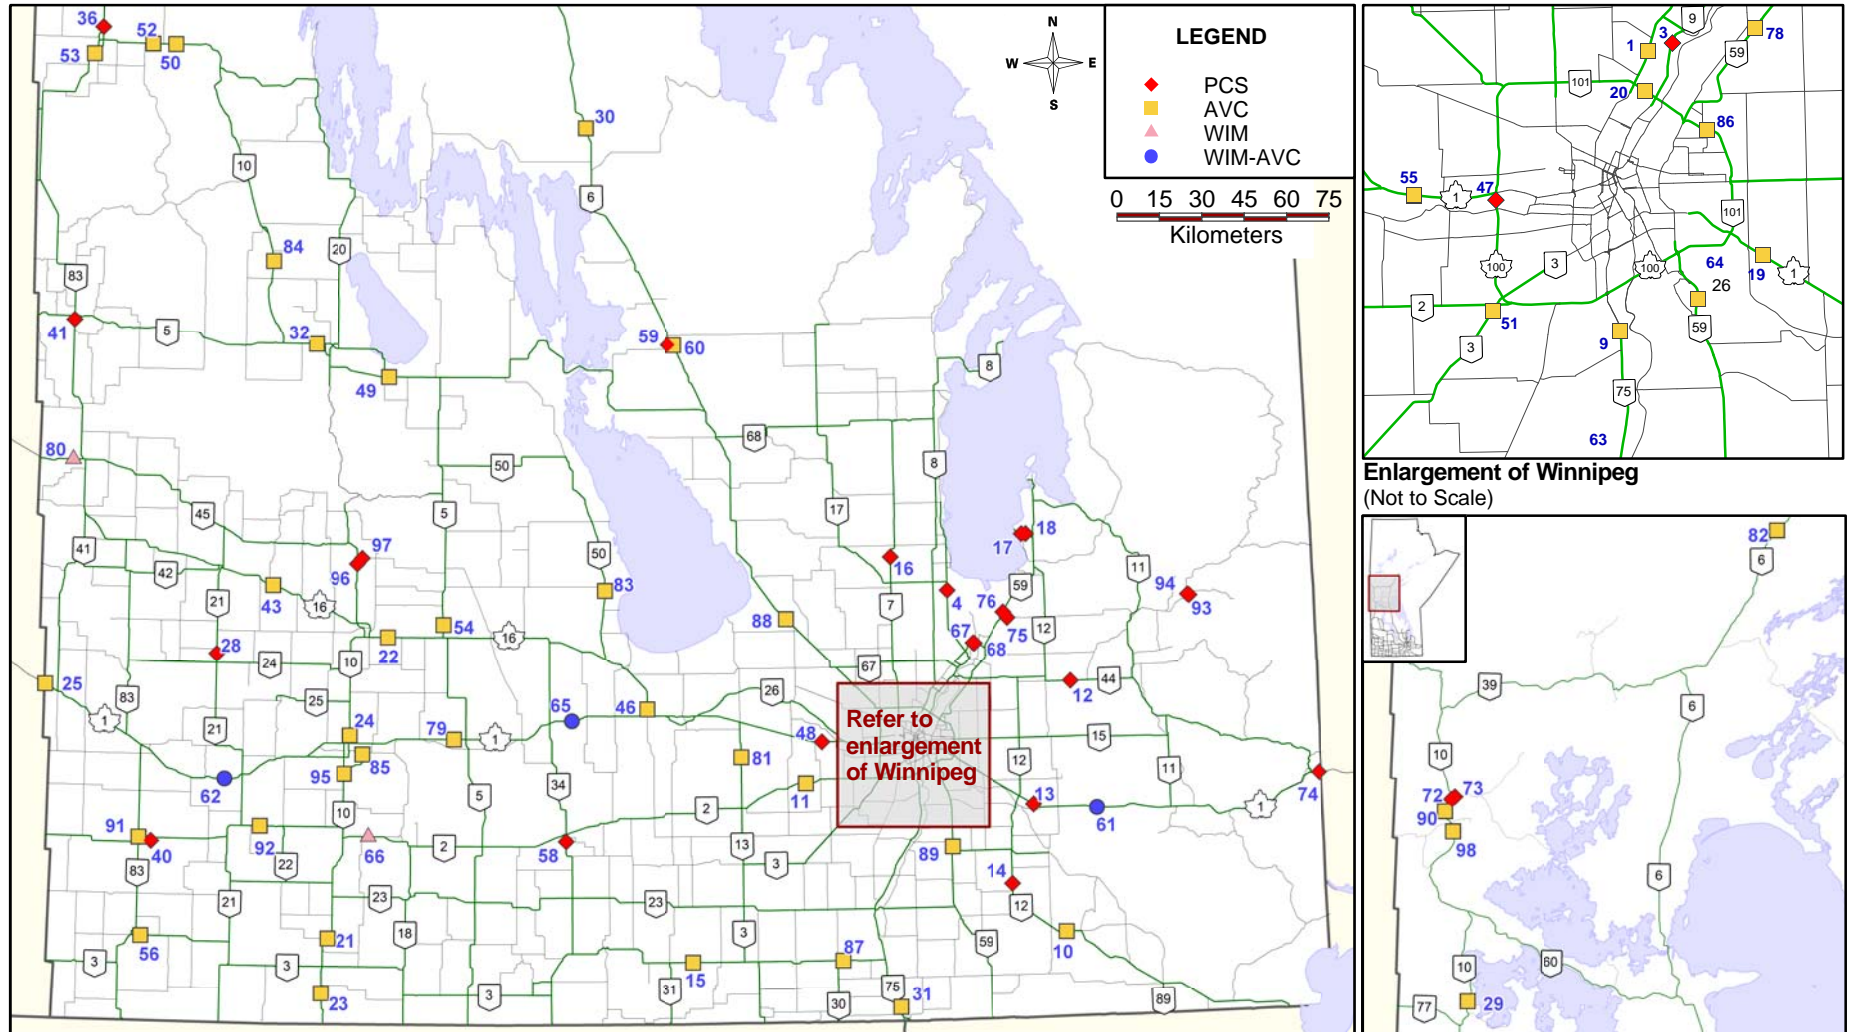

SECTION II: PERMANENT TRAFFIC COUNT STATIONS

In 2014, Manitoba Infrastructure and Transportation improved the Province's highway network through various construction initiatives. Additionally, efforts have been made to upgrade Permanent Traffic Count Stations from PCS to AVC. Permanent traffic count stations where estimates for AADT or AADTT were affected by construction, removal, or equipment malfunction/maintenance are summarized in the following table.

Station	Explanation for Inability to Estimate AADT or AADTT	Result
15	Equipment malfunction ¹ from January to September in the Westbound direction	AADT/AADTT are based on 2 TIMES the Eastbound Traffic
20	Equipment malfunction ¹ (Station not classifying vehicles in the Eastbound direction)	AADTT based on 2 TIMES the Westbound Traffic
31	Equipment malfunction ¹ from June to September (Station not classifying vehicles in the Northbound direction)	AADTT based on 2 TIMES the Southbound Traffic
46	Equipment malfunction ¹ from April to June (Station not classifying vehicles)	AADTT not estimated
47	Equipment malfunction ¹ during the month of November	AADT not estimated
49	Equipment malfunction from August to September and November through December (Station not classifying vehicles)	AADTT not estimated
52	Equipment malfunction ¹ (Station not classifying vehicles)	AADTT not estimated
60	Equipment malfunction ¹ (Station not classifying vehicles)	AADTT not estimated
63	Equipment malfunction ¹ in June and September	AADT/AADTT not estimated
65	Equipment malfunction from May to June and October through December	AADT/AADTT not estimated
66	Equipment malfunction from January to June in the Eastbound direction	AADT/AADTT are based on 2 TIMES the Westbound Traffic
74	Equipment malfunction from June to August	AADT not estimated
79	Equipment malfunction from November through December	AADT/AADTT not estimated
80	Equipment malfunction during the months of April and November	AADT/AADTT not estimated
91	Equipment malfunction during the month of July	AADTT not estimated

¹ Equipment malfunction in this table usually refers to major loop and/or sensor damage requiring repair or replacement. The malfunctions can last for several months because the loops and/or sensors are installed below the pavement surface and the repairs can be impeded by weather, construction activity, and other factors. Minor malfunctions that are corrected quickly without subsurface work are not reported in this table, because the minor malfunctions cause only short data gaps that do not hinder AADT or AADTT estimation.

SECTION III: TRAFFIC STATISTICS FOR PROVINCIAL TRUNK HIGHWAYS AND PROVINCIAL ROADS

In order to reduce the size of this printed traffic report, estimates prior to 2008 are not presented here. Due to limited resources at MIT, from 2012 onward the CCS's are counted on a three year rotation rather than the former two year rotation. All existing traffic estimates prior to 2008 are available via the MHTIS webmap (www.mhtis.mb.ca), as discussed in Appendix B: Traffic Information via the Internet.

Indicates that raw data exists, but the AADT, ASDT%, or 30thHour% were not estimated. This occurs when the control station does not have sufficient data and the CCS is expanded by its respective traffic pattern group.

Example CCS Expansion Calculation

The following shows an example of how the CCS counts are expanded by their respective control Station's PCS;

Raw counts are obtained by MIT and forwarded to the MHTIS manager (shown in Appendix A as seen below).

• Raw Data for Coverage Counts Completed in 2011 •									
Sta No	Dir	Start Date	Start Time	End Date	End Time	Loop?	Count	Hwy No	Location Description
265	C	26/07/2011	928	28/07/2011	928	N	1,417	3	W. OF W. JCT. P.T.H. #34
265	C	19/09/2011	1306	21/09/2011	1306	N	1,495	3	W. OF W. JCT. P.T.H. #34

Both raw counts are then expanded by the axle expansion factor.

$$(1 - \%T) + (2.5 \times \%T)$$

where: %T is the most recently available percentage of trucks on the road, or the default value of 10% (expressed as a decimal). The percentage of trucks is the ratio of AADTT to AADT estimated at a given location. These percentages are derived from the latest truck counts at each individual CCS station. For Station 265 the %T is equal to 10.1%.

$$\text{axle conversion factor} = (1 - 0.101) + (2.5 \times 0.101) = 1.1515$$

The raw counts are then divided by the axle correction factor to produce the converted count.

$$\text{Converted Count}_{July} = 1,417 / 1.1515 = 1231$$

$$\text{Converted Count}_{Sep} = 1,495 / 1.1515 = 1298$$

The method used for expanding short-period counts is based on the assumption that when a short sample of traffic is taken at the survey site and at the control site, each sample represents the same proportion of the site's AADT. The short-period count is converted to an AADT estimate by the following equation:

$$\frac{V_{site}}{AADT_{site}} = \frac{V_{ctrl}}{AADT_{ctrl}}$$

where: V_{site} = Converted count volume recorded at the CCS site (48-hour)
 V_{ctrl} = Volume recorded in the same time period at the control station or group (48-hour)
 $AADT_{site}$ = Estimated AADT at the CCS site
 $AADT_{ctrl}$ = Calculated AADT at the control station or group

The $AADT_{ctrl}$ is the calculated AADT for the last reporting period at the control station. The V_{ctrl} is the observed volume at the control station during the same time period as the short-term count was taken. If data is not available for V_{ctrl} , then the ratio $V_{ctrl}/AADT_{ctrl}$ is taken to be the average ratio for that time period for all sites that fall within the appropriate traffic pattern group.

$$AADT_{site} = \frac{V_{site}}{V_{ctrl}} \times AADT_{ctrl}$$

$$CCS\ 265: AADT_{july} \text{ based on control station 15 EB} = \frac{1231}{2292} \times 1010 = 542$$

$$CCS\ 265: AADT_{july} \text{ based on control station 15 WB} = \frac{1231}{2349} \times 1020 = 534$$

$$CCS\ 265: AADT_{sept} \text{ based on control station 15 EB} = \frac{1298}{2081} \times 1010 = 630$$

$$CCS\ 265: AADT_{sept} \text{ based on control station 15 WB} = \frac{1298}{2025} \times 1020 = 654$$

The final step averages all the counts to produce the CCS stations expanded AADT.

$$(542 + 534 + 630 + 654)/4 = \mathbf{590}$$

The AADT for station 265 can be seen on page III-16 of this section.

SECTION IV: TOWN COUNT STATIONS

In order to reduce the size of this printed traffic report, estimates prior to 2008 are not presented here. All existing traffic estimates prior to 2008 are available via the MHTIS webmap (www.mhtis.mb.ca), as discussed in Appendix B: Traffic Information via the Internet.

Sample Town Count ADT Calculation

The following shows an example of how the town count station data is expanded to an ADT.

Raw counts are obtained by MIT and forwarded to the MHTIS manager (shown in Appendix A as seen below).

• Raw Data for Coverage Counts Completed in 2011 •									
Sta No	Dir	Start Date	Start Time	End Date	End Time	Loop?	Count	Hwy No	Location Description
6016	NB	11/07/2011	715	13/07/2011	715	N	9,787	391	THOMPSON - S. OF THOMPSON DRIVE N.
6016	NB	14/09/2011	910	16/09/2011	910	N	10,173	391	THOMPSON - S. OF THOMPSON DRIVE N.

Both raw counts are then expanded by the axle expansion factor.

$$(1 - \%T) + (2.5 \times \%T)$$

where: $\%T$ is the most recently available percentage of trucks on the road, or the default value of 9% (expressed as a decimal). The percentage of trucks is the ratio of AADTT to AADT estimated at a given location. These percentages are derived from the latest truck counts at each individual town count station. For Station 6016 the $\%T$ is not available, so the default value of 9% is used.

$$\text{axle conversion factor} = (1 - 0.09) + (2.5 \times 0.09) = 1.135$$

The raw counts are then averaged and multiplied by the axle conversion factor.

$$\text{Converted Town Count}_{station} = \frac{\sum \text{counts}}{(\text{number of days} * \text{axle conversion factor})}$$

So, the converted town count for Station 6016 in the NB direction would be:

$$\text{Converted Town Count}_{6016NB} = (9,787 + 10,173) / (2 * 2 * 1.135) = 4,400$$

The AADT for Station 6016 in the NB direction can be seen on page IV-22 of this section.

APPENDIX A: COVERAGE COUNT RAW DATA

This section lists the raw data from coverage counts conducted in 2014. The following explains what each column in this section represents:

- Sta No:** Station number at which the count was taken
- Dir:** Direction of traffic flow
C – Combined
NB – Northbound
SB – Southbound
EB – Eastbound
WB – Westbound
- Start Date:** Date when count started
- Start Time:** Time when count started
- End Date:** Date when count ended
- End Time:** Time when count ended
- Loop?:** Type of counter used to collect the traffic counts
Y – Loop counter
N – Tube counter
- Count:** Number of vehicles counted
- Hwy No:** Highway number on which the station is located
- Location Description:** Description of where the station is located

Example:

Sta No	Dir	Start Date	Start Time	End Date	End Time	Loop?	Count	Hwy No	Location Description
104	C	9/21/2011	1030	9/23/2011	1030	N	794	307	N. OF CPR. TRACKS AT BRERETON

This example shows the coverage count information for Station 104 for the combined direction of traffic flow. The count was started at this station on September 21 at 10:30 and ended two days later on September 23 at 10:30. The counter used for this station was a tube counter. During this period (48 hours), the observed two-way traffic at this location was 794 vehicles. Station 104 is located on P.R. #307, North of the CPR tracks at Brereton.

Number of Surveys: 1142

Number of Unique Locations: 559

1. INTRODUCTION

As part of MHTIS, the University of Manitoba Transport Information Group (UMTIG) has managed a website to disseminate traffic information for the past several years. In 2006, UMTIG upgraded their website through design, development, and implementation of an integrated geospatial web-based traffic information system, or webmap.

This system facilitates ready use of the MHTIS for various branches within local, provincial, and federal governments, transportation engineering researchers, other professionals, and the general public. Providing open access to traffic information enhances understanding of the geographic and temporal traffic characteristics on Manitoba's road network and promotes effective transportation planning, programming, regulating, and investment decision-making.

2. MHTIS WEBSITE

2.1 Software

Intergraph's GeoMedia WebMap Publisher is used to publish the traffic data and post it to the MHTIS website. Users are able to view the site using an internet browser such as Internet Explorer. The system can be accessed from the following internet address:

<http://www.mhtis.mb.ca>

2.2 Databases

Four datasets are utilized in the web-based mapping application:

Base Map Geography

This dataset includes geographic features for visual display and analysis of traffic information in Manitoba. Spatial layers include: (1) administrative boundaries, including provincial and territorial boundaries in Canada and state boundaries in the United States; (2) major water bodies and river systems in Manitoba and the surrounding area; and (3) population centres in Manitoba.

Adjacent Jurisdictions

Relevant geographic information for adjacent jurisdictions is also included in the webmap application. Three data warehouses support mapping of adjacent jurisdictions:

- *National Data* – includes the national highway system in Canada, the Brandon road network and some town roads in Manitoba.
- *US Data* – includes the interstate highway system in the United States.
- *Winnipeg Data* – includes major routes through and in Winnipeg.

The purpose of this dataset is to show the major connecting highway routes to and from Manitoba and the urban corridors through Winnipeg that are a continuation of the provincial highway network. Incorporation of spatial data from adjacent jurisdictions places the Manitoba highway network in the larger context of the Canadian and North American transport systems and supports future integration of traffic volume information from other jurisdictions.

MHTIS Data

The MHTIS dataset contains both geographic and attribute information, which characterize the highway network in the province and the associated traffic information on highway segments. The *MHTIS_GIS* warehouse includes:

- *Traffic Counting Stations* – Point features showing the location of the traffic counting stations in Manitoba, including permanent count stations (PCS), coverage count stations (CCS), and town counters (TOW).
- *Provincial Highway Network* – Line features showing the provincial trunk highways (PTHs) and provincial roads (PRs) in the province. Road segments are subdivided into traffic control sections and traffic control sequences to facilitate linkages between traffic information obtained from traffic counters and the spatial features representing the highway network.
- *Highway Regions* – Area features showing the boundaries of the five highway regions in Manitoba.
- *Traffic on Manitoba Highways* – Traffic flow data for the most recent year is linked to the provincial highway network. Traffic flow estimates are available for individual highway segments within the network by clicking on or mousing over the segment in the map window. Historic traffic flow maps can be obtained for the years 2000 through to the most recent year in PDF format.

TITAN and Miovision Data

The TITAN and Miovision database contains the location of TITAN and Miovision counts in Manitoba. A spatial layer shows the point locations of all TITAN and Miovision counts conducted between 2000 and the most recent year and an associated attribute table (which can be joined to the spatial file through the location description) provides additional information. Hyperlinks defined within the attribute database allow users to access detailed count data in PDF format.

3. MHTIS WEBMAP FEATURES

GeoMedia Webmap Publisher provides a number of ways to view and access spatial and attribute data. To effectively use the MHTIS website it is important to understand how the data is organized and displayed within the webmap viewing window. When the webmap component of the MHTIS website is first visited, a general map of Manitoba is displayed (as shown in Figure 1). The purpose of this map is to define a reference area for the overview map located in the top left corner of the viewing window. Data is available from the detail maps listed on the left hand side of the viewing window.

3.1 Webmap Viewing Window

There are five main areas in the webmap viewing window (Intergraph 2005). These are shown in Figure 1 and described below.

1. Themes and Maps:

This area displays the organization of GIS data that is available for viewing in the map window. The data is organized into two levels – themes and maps. Themes contain one or more maps that are related to each other in some way. A map is defined by the contents of the legend (which layers are available and how they are displayed), which commands are available in the toolbar, and which queries are available in the Queries command.

For example, MHTIS data is categorized into three themes within the webmap application: (1) Traffic Data, containing two maps - counting stations and traffic flow; (2) Traffic Data History, which contains one map with links to historic flow data in PDF format; and (3) TITAN Counts, with one map showing the TITAN traffic count locations in Manitoba and the associated attribute data.

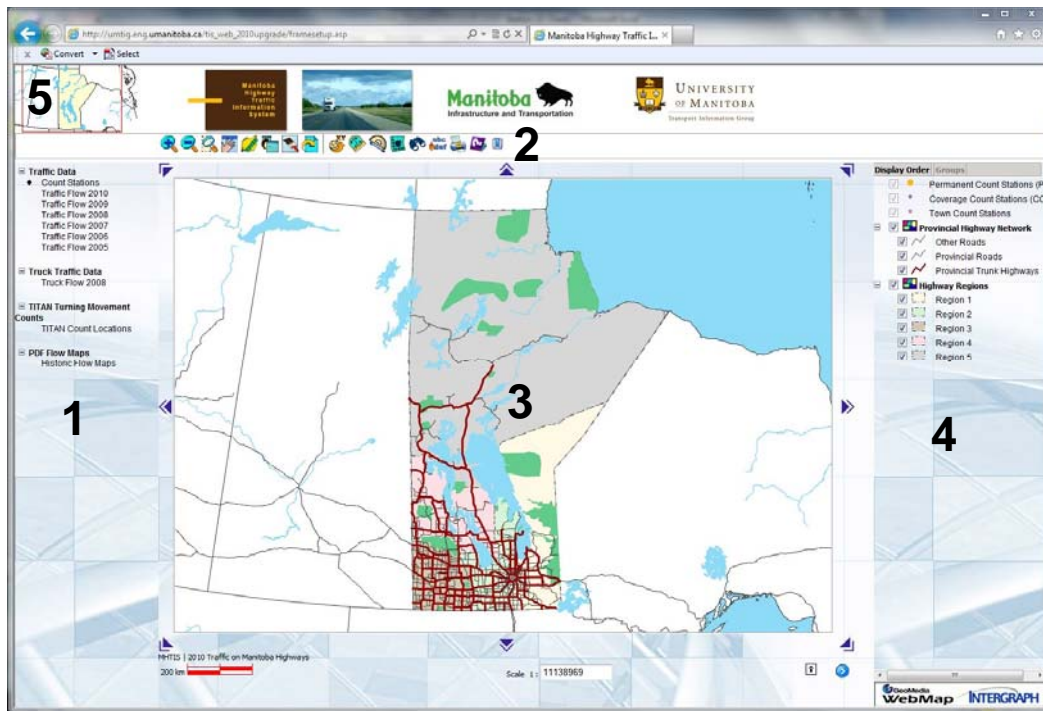

Figure 1: Webmap Viewing Window

2. *Toolbar:*

The toolbar contains commands for manipulating the data in the map window and for reporting feature attributes. Section 3.2 describes each of the tools available in the toolbar.

3. *Map View:*

The map view displays the map itself, the scale bar, and the scale.

4. *Legend:*

The legend displays which legend entries (layers) are available for display in the map window, as well as information about how each legend entry is displayed (including styles, hotspots, and tooltips).

5. *Overview Map:*

The overview map shows an overview image and the current map view in relation to the overview image (the current viewing area is shown as a red box on top of the overview image).

3.2 WebMap Commands

Each map is assigned a specific set of commands (as seen in the toolbar). This assignment is based on the types of data that are available and how the data can be accessed. Therefore, the toolbar may be different for each map listed on the left panel of the viewing window. In general, webmap commands allow users to view the data, take measurements, select features and run predefined queries. Table 1 provides a comprehensive list of the commands and their functions.

Table 1: Webmap Commands

Toolbar Button	Command	Function
	Zoom In	Select the zoom in command and then click anywhere on the map to zoom in to a region. The regenerated map will be centered on the point where the mouse was clicked.
	Zoom Out	Select the zoom out command and then click anywhere on the map to zoom out of a region. The regenerated map will be centered on the point where the mouse was clicked.
	Zoom by Area	Select the zoom by area command and then click once in the map window. A shaded rectangle will appear. Drag the corner of the rectangle to the desired location and click again. The map will be regenerated, showing a zoom of the rectangular area.
	Pan	Select the pan command and then click once in the map window to define a starting point for the pan operation. Click again in the map window to define an end point. The map will shift according to the direction and distance defined by the pan line. Alternatively, use the directional pan buttons on the periphery of the map window to shift the map in a particular direction or hold down the alt key while panning with the mouse in the map window.
	Map Area	Click on the map area button and a window will appear listing the zoom regions available for this command (Winnipeg, Portage La Prairie, Brandon, Steinbach, Selkirk, Dauphin, Winkler, Morden, Swan River, and Roblin). Select a region by clicking on the red pin beside the location description. The map will automatically zoom to the selected region.
	Fit Map	Select the fit map command and then click once in the map window. The map will be regenerated showing the full extent of the map area that is available for viewing.
	Fit Select Set	Click on the fit select set button and the map will automatically zoom to the features in the select set.
	Zoom Previous	Click on the zoom previous button and the map will automatically be regenerated at the previous zoom level.
	Refresh Map	Click on the refresh map button and the current map view will be refreshed from the server (this command maintains the current zoom factor). Use this command to clear a select set.
	Reload Website	Click on the reload website button and the map window will be redirected to the overview map. The website will be reloaded from the server.
	Measure Distance	Select the measure distance command and then click once in the map window to define the starting point. Click one or more times in the map window to define a polyline. Double click the last point to end the line. A window will appear indicating the total length of the polyline in the units of measure defined in the options command.
	Measure Area	Select the measure area command and then click once in the map window to define the starting point of the polygon. Click in the map window to define the remaining coordinates of the polygon. Double click the last point to end the polygon. A window will appear indicating the total area in the units of measure defined in the options command.
	Select by Point	Click once anywhere in the map window. A data window will open to display all the locatable features at or around the point.
	Select by Circle	Define a circle by clicking on the map to place the center point of the circle and then moving the mouse cursor to define the radius. Click again to finish defining the circle. A data window will open to display all the locatable features within the circle.
	Select by Rectangle	Define a rectangle by clicking on the map to place the first corner of the rectangle and then clicking again to place the opposite corner of the rectangle. A data window will open to display all the locatable features within the rectangle.
	Predefined Queries	Select the predefined queries command to access a customized set of queries for locating features. Predefined queries are discussed in detail in Section 3.3
	Options	Select the options command to select the units and formats that are used in the map window and other miscellaneous options.
	Print	Select the print command to print the contents of the map window.
	Help	Select the help command to access additional help files for the webmap component of the MHTIS website.

3.3 Predefined Queries

Predefined queries are customized queries developed in GeoMedia Webmap Publisher that allow users to easily access commonly requested data. The current map determines which queries are accessible (see Table 2). The subsequent discussion illustrates how to run the queries and what types of data are retrieved.

Table 2: Predefined Queries

Theme	Map	Predefined Queries
Traffic Data	Counting Stations	Town, Station, HwyNo
	Traffic Flow	Town, HwyNo
Traffic Data History	Historic Flow Maps	None
TITAN Counts	TITAN Count Locations	HwyNo, TITAN

Town Query

This query selects the specified town and zooms the map window to the area surrounding the town (the zoom factor is defined in the query by the user). Figure 2 shows the town query window. The user selects a town from the dropdown list and a zoom factor from the 'Min width' menu and clicks the 'Find' button. The results are displayed in the query window beneath the criteria entered by the user.

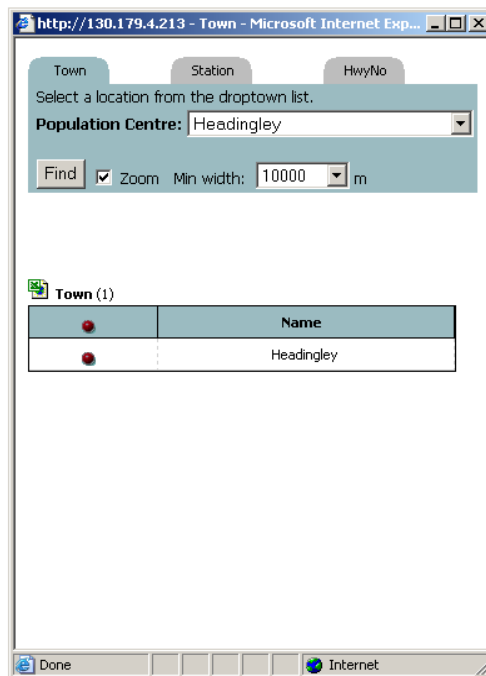

Figure 2: Town Query Window

In this example, the map window is centered on the town of Headingley (see Figure 3). The user is now able to view the counting stations that are near or in the town of Headingley. Moving the mouse cursor over the counting stations activates the tooltip for the counting station layer, showing the station number. Clicking on the station activates the hotspot, which opens a new window with historic and current traffic data for the station.

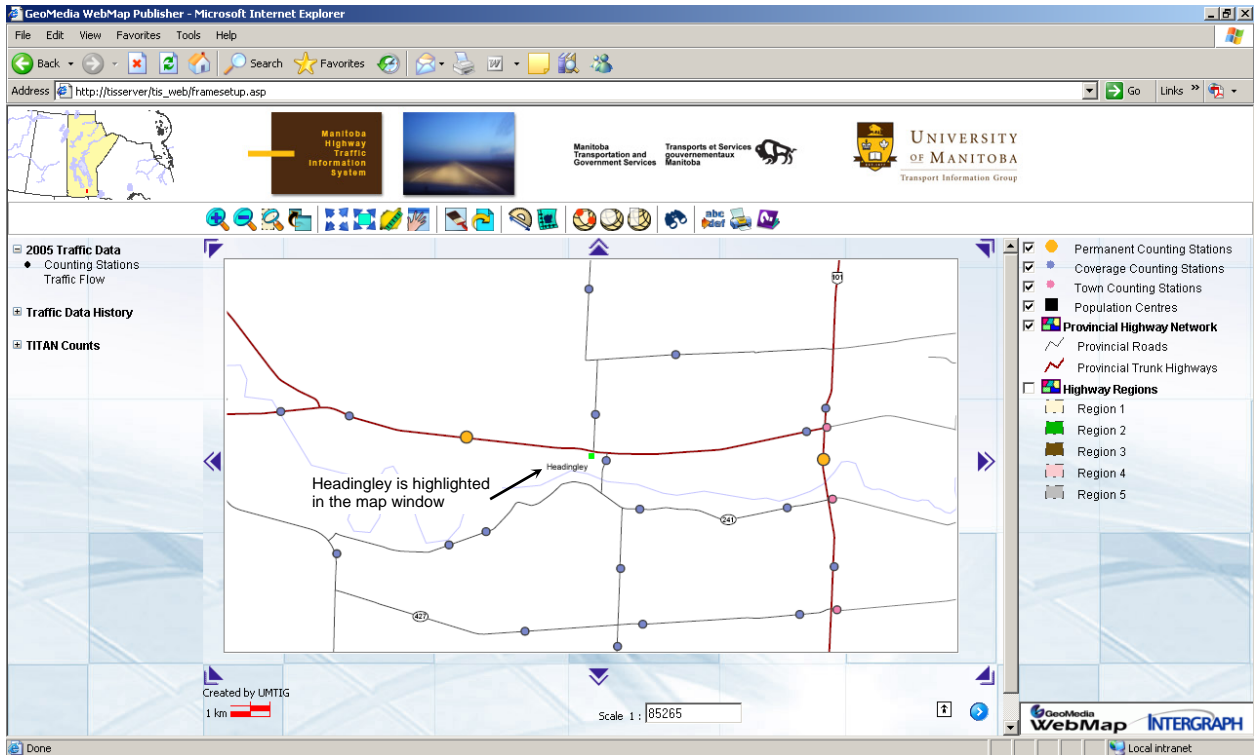

Figure 3: Town Query Map Display for Headingley

Station Query

If the station number is known, the station query can be used to find the station location on the map and access the associated attributes and traffic data. Figure 4 shows the station query window. The user enters the station number in the text box, selects a zoom factor from the 'Min width' menu, and clicks the 'Find' button. The attributes are shown in the query window and the map window zooms to the selected station (see Figure 5). The station is highlighted with a small fluorescent green dot.

Figure 4: Station Query Window

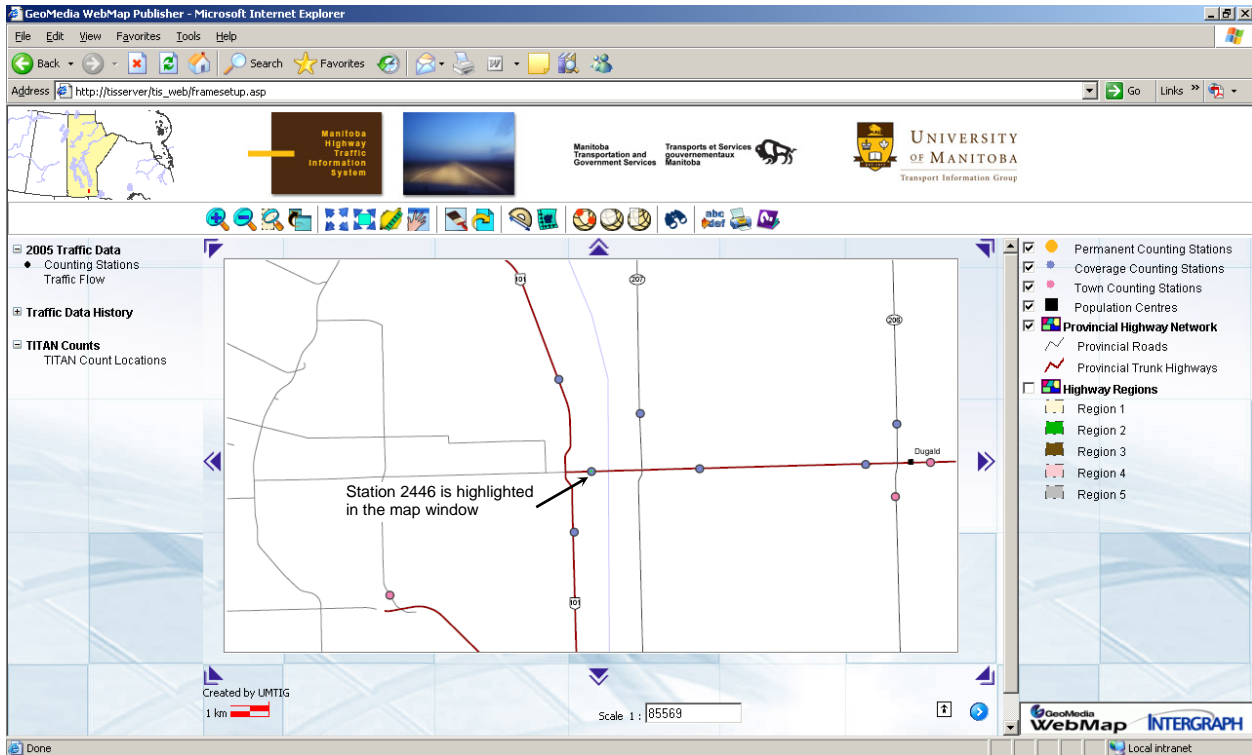

Figure 5: Station Query Map Display for Station 2446

HwyNo Query

This query allows users to find a specific highway in the map window. The user enters the highway number in the text box and the query retrieves all the records that match the specified criteria. Figure 6 shows the results of this query for PTH 52. Since more than one record was selected by the query, the map does not automatically zoom to the selected features. The user can locate any or all of the highway segments in the map window by clicking on the red pin beside the record. Clicking on the red pin in the top left hand corner of the table selects all of the records, adds them to the select set, and highlights them on the map (as shown in Figure 7).

Figure 6: HwyNo Query Window

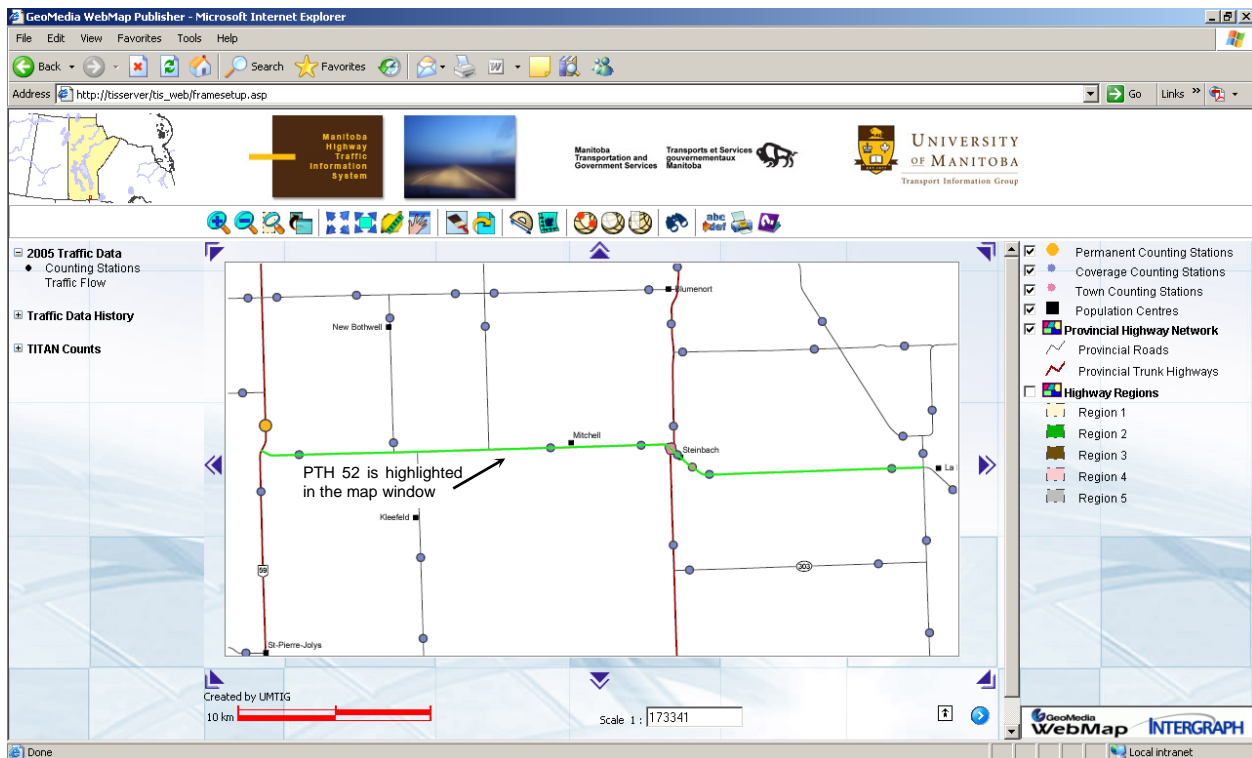

Figure 7: Selection of PTH 52 Highlighted in the Map Window

TITAN Query

The TITAN query retrieves TITAN count locations in select Manitoba communities. The user selects a location from the dropdown menu and clicks the 'Find' button. The query displays a list of the point locations of TITAN counts that are in or near the community selected by the user. Figure 8 shows the TITAN query window for TITAN counts in Morden. There are seven locations in the town of Morden that had TITAN counts between 2000 and 2005.

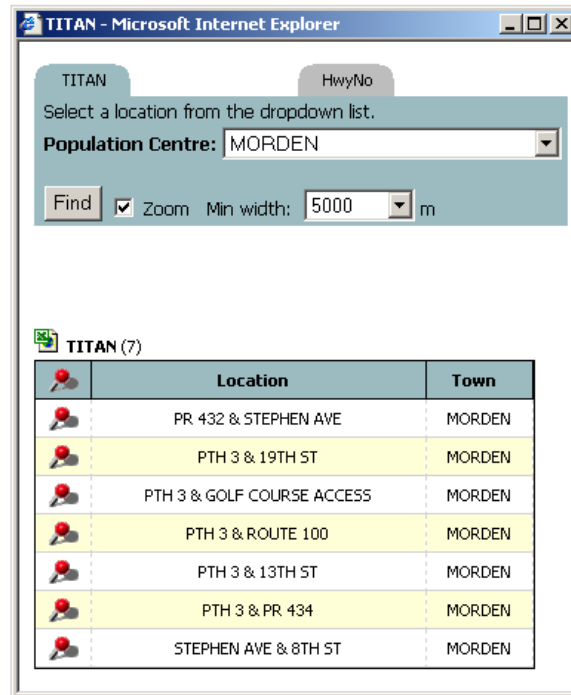

Figure 8: TITAN Query Window

The red pins in the query window (left hand column) are used to select particular count locations and zoom to the region in the map window (see Figure 9). Once the location has been found in the map window, the user clicks on the yellow point to determine how many counts were taken at that location and when the counts were conducted. Count details can be accessed via the hyperlinks in each data window (see Section 4.3)

Figure 9: TITAN Query Map Display

4. OBTAINING DATA

Traffic data can be obtained from the webmap through a number of different techniques.

4.1 Tooltips

The simplest form of gathering information is to glide the mouse over features in the map window. Tooltips display characteristics about the feature as the mouse passes over them. For example, in the *Counting Stations* map (located in the Traffic Data theme), a tooltip displays the station number. In the *Traffic Flow* map, mousing over a highway segment displays the highway number and the AADT on that link.

4.2 Hotspots

Hotspots initiate an action when a particular feature is selected with the mouse. Hotspots are defined in all of the maps for features that are locatable by the user. When the user clicks on a feature (the feature will turn fluorescent green to indicate that it is locatable) a window will appear, displaying either a summary traffic report or the attributes for that feature.

4.3 Hyperlinks

Hyperlinks are connections to external data that can be accessed from the map window. Historical flow maps in PDF format are available from the map entitled *Historic Flow Maps* (located in the Historic Flow Data theme). Clicking on the region of Manitoba will open a data window with hyperlinks to the traffic flow maps from 2000 to the most recent year (see Figure 10). Click on the hyperlink to access the PDF file.

Figure 10: Historic Flow Maps Data Window

Hyperlinks are also available in the *TITAN Count Locations* map (located in the TITAN Counts theme). Clicking on a TITAN count location (shown as a yellow circle in the map window) opens a data window with hyperlinks to PDF files showing details of the count.

For example, Figure 11 shows the count data available for the intersection of PTH 2 and PR 332. Two counts were taken at this location, one in 2002 (PRN 2998) and one in 2001 (PRN 2259). Both counts are listed in the same data window. To access the PDF file, click on the hyperlink shown in bold blue lettering in the PDF field. In general, each TITAN count will have a separate PDF. A few counts have insufficient data to create the PDF summary file (such as PRN 2298 in this example). In these cases, the message 'No PDF for this count' will appear in the PDF field.

APPENDIX D: INTERSECTION COUNT LOCATIONS (TITAN & MIOVISION)

In order to reduce the size of this printed traffic report, Titan Turning Movement Counts and Miovision Turning Movement Counts prior to 2008 are not presented here. All existing counts prior to 2008 are available via the MHTIS webmap (www.mhtis.mb.ca), as discussed in Appendix B: Traffic Information via the Internet. Please note that the year 2000 is the earliest year for which turning movement archive data is available.
